### **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bluemel (US 6,384,489) in view of Amano (US 2002/0158513).

With respect to claim 1, Bluemel discloses a power supply circuit for a motor vehicle electric system having: a starter and a generator (S and G in Fig. 1), a power electronics system (W1, W2, W3, HV, and LV in Fig. 1), at least one battery (B1 in Fig. 1), at least one dynamic energy accumulator (B2 in Fig. 1) and a DC/DC converter (W1 and W2 in Fig. 1), wherein the starter and generator can be connected to the vehicle electric system via a first connection branch in which the DC/DC converter is arranged (Z1 in Fig. 1), wherein the starter and generator can be connected to the vehicle electric system via a second connection branch (Z2 in Fig. 1), both the first and the second connection branches each have, at their side connected to the starter and generator, a respective switch (contained in each DC-DC converter W1 and W2 in Fig. 1, also there is an additional switch LS in Fig. 2 and Fig. 1, although it is not labeled in Fig. 1) by means of which the respective connection branch can be disconnected from the starter and generator, the battery is connected on the vehicle electric system side of the switch between the second connection branch and ground (as seen at the connection of battery B1 to Z2 in Fig. 1), the energy accumulator is connected between ground and the first connection branch at a point

Art Unit: 2838

between the switch in the first connection branch and the DC/DC converter (as seen at the connection of accumulator B2 to Z1 in Fig. 1), and a control device (W3 in Fig. 1 and col 2 ln 37-59) is formed which actuates the switches in the first and the second connection branches and the DC/DC converter in response to a charge state of the battery and of the energy accumulator and an operating state of the motor vehicle (col 5 ln 33-56) such that recuperation energy which is present in the energy accumulator is stored and recuperation energy which is present is optionally used to charge the battery if the energy accumulator is fully charged (col 6 ln 34-58 and col 5 ln 10-55), drive support is provided by energy from the energy accumulator as soon as the energy accumulator is charged after an initial start (col 5 ln 15-18), and drive support is provided from the battery up to this time (col 6 ln 30-58 and col 7 ln 4-13), for a rapid start energy is used from the energy accumulator (col 5 ln 10-18 and col 6 ln 44-48), the battery is charged according to its charged state as required (col 6 ln 51-58 and col 7 ln 13-23), and after a recuperation the vehicle electric system is fed via the battery (col 6 ln 5-33 and col 7 ln 13-28).

Furthermore, it is well known that a conventional DC-DC converter, as used by the Bluemel reference, contains a switch in order to control the use (and duty cycle) of the converter (col 3 ln 28-31 and col 5 ln 24-41).

However, Bluemel does not expressly disclose wherein the generator is a starter generator.

Amano discloses a starter generator in power supply equipment for a motor vehicle (no. 2 in Fig. 1 and para 0002 and 0012), in order to provide a power system with less parts and requiring less space, while also improving fuel efficiency.

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to include a starter generator in the system of Bluemel, as did Amano, so that the system could be made of less parts, would be easier to manufacture, and would have improved fuel efficiency.

With respect to claim 2, Bluemel discloses the power supply circuit wherein a monitoring device is also formed (W3 in Fig. 1 and col 5 ln 33-56) which monitors the charge state of the battery and of the energy accumulator and transfers the monitoring result to the control device (W3 in Fig. 1, contains both monitoring and controlling circuitry).

With respect to claim 3, Bluemel discloses the power supply circuit wherein the switches are embodied as controllable switches and further discloses wherein there is another switch which is a controllable semiconductor switch (col 3 ln 28-37 and col 6 ln 20-24), however, does not expressly disclose wherein the switches used in the DC-DC converters on the first and second connection branches are semiconductor switches.

It is well known to one of ordinary skill in the art that conventional DC-DC converters can use semiconductor switches as the controllable switches, in order to control the duty cycle and reach a proper output while keeping a low cost and low failure rate.

Amano uses controllable semiconductor switches (as seen in no. 3, 11, and 12 in Fig. 1) in the power control system, in order to supply the desired amount of power for the system's use while also having the ability to separate the battery from the start-up of the engine (abs ln 6-9).

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to include semiconductor switches in the connection branches of the system of Bluemel, as did Amano, so that a desired output could be reached and so that the battery could be quickly separated or connected to various components of the system as needed, while still keeping the costs and difficulty of production of the system at a minimum value.

With respect to claim 4, Bluemel discloses the power supply circuit wherein the dynamic energy accumulator is embodied as a capacitor (col 5 ln 10-14).

With respect to claim 5, Bluemel discloses the power supply circuit wherein the capacitor is embodied as a supercap or ultracap (col 5 ln 10-14).

With respect to claim 6, see the rejection of claim 3 above.

## Response to Arguments

3. Applicant's arguments filed September 13, 2006 have been fully considered but they are not persuasive.

With respect to claim 1, applicant argues that Bluemel has an accumulator B2 that can never be disconnected to the starter generator, and therefore, the switch would not be between the accumulator B2 and the starter generator.

Examiner respectfully disagrees for the following reasons: The claim does not recite that the accumulator can be disconnected from the starter generator, and even if it did, the energy accumulator of Bluemel can be disconnected from the starter generator, as is well known to those of normal skill in the art, in the same manner that all components can be attached/detached from wiring. Furthermore, the switch can reasonably be interpreted to be between the accumulator B2 and the starter generator if you look at the different paths of the circuit. There is more than one path, and even though one of the paths seems to be directly connecting the accumulator B2 and the starter generator, there are other paths that have a switch between the accumulator B2 and the starter generator (more clearly seen in Fig. 2 than in Fig. 1).

Art Unit: 2838

### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Aaron Piggush whose telephone number is 571-272-5978. The examiner can normally be reached on Monday-Friday 8:30am-5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Karl Easthom can be reached on 571-272-1989. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
